

Scaling a marketplace for entrepreneurs that compares third-party products.

LONG TERM VISION

ING Business Banking aimed to become the default relationship for entrepreneurs, by enabling a full suite of business administration functionality on a bank agnostic platform. This platform should host bank and non-banking services of ING and 3rd parties to become future-proof to new competitors.

PROJECT

One of the main initiatives is a marketplace called ING + Partners. The purpose is to guide users in finding, comparing and buying the right 3rd party solutions for their business needs in an objective matter. The business model is fee-based, the partners are responsible for their own content and the first product range is based on rapid growth to create a network effect.

I stepped into the project when the first category was live and scaling was planned to at least 10 categories in a year. After the first weeks I saw many usability- and scalability issues, therefore advised a re-design.

ROLE

Senior UX Designer
Usability Researcher

WHEN

2019

ACHIEVEMENT

Average System Usability Score of 75 (N=5)

TOOLS

Sketch
Invision

The process

EXPERT REVIEW

Quickly run through the pages to evaluate where the pain points are to create focus for further steps.

BENCHMARK

Decide together with the Squad against which 10 competitors / ecommerce parties to benchmark.

DESK RESEARCH

Investigate ecommerce and UX best practices & lessons learned on category pages, product pages and the elements on those pages.

PRIORITIZED LIST OF FINDINGS

Excel generated list of usability findings based on the previous three steps. The findings were given an rating on severity or impact, while grouped into slices to be picked up together. Slicing was meant to create planning clarity, clear user value iterations and an easier decision process about the scope of the re-design.

FIRST DESIGNS

Slices with big to medium impact were approved by the Product Owner to be re-designed. I created the first happy flow designs for desktop for the bookkeeping categorie, because that was the most used screen and categorie

PERSONA WALKTHROUGHS & SQUAD REVIEW

By walking through my designs as the personas of the bookkeeping categorie I tested them out and perfected the design. After that presented my design as a story from the different persona perspectives.

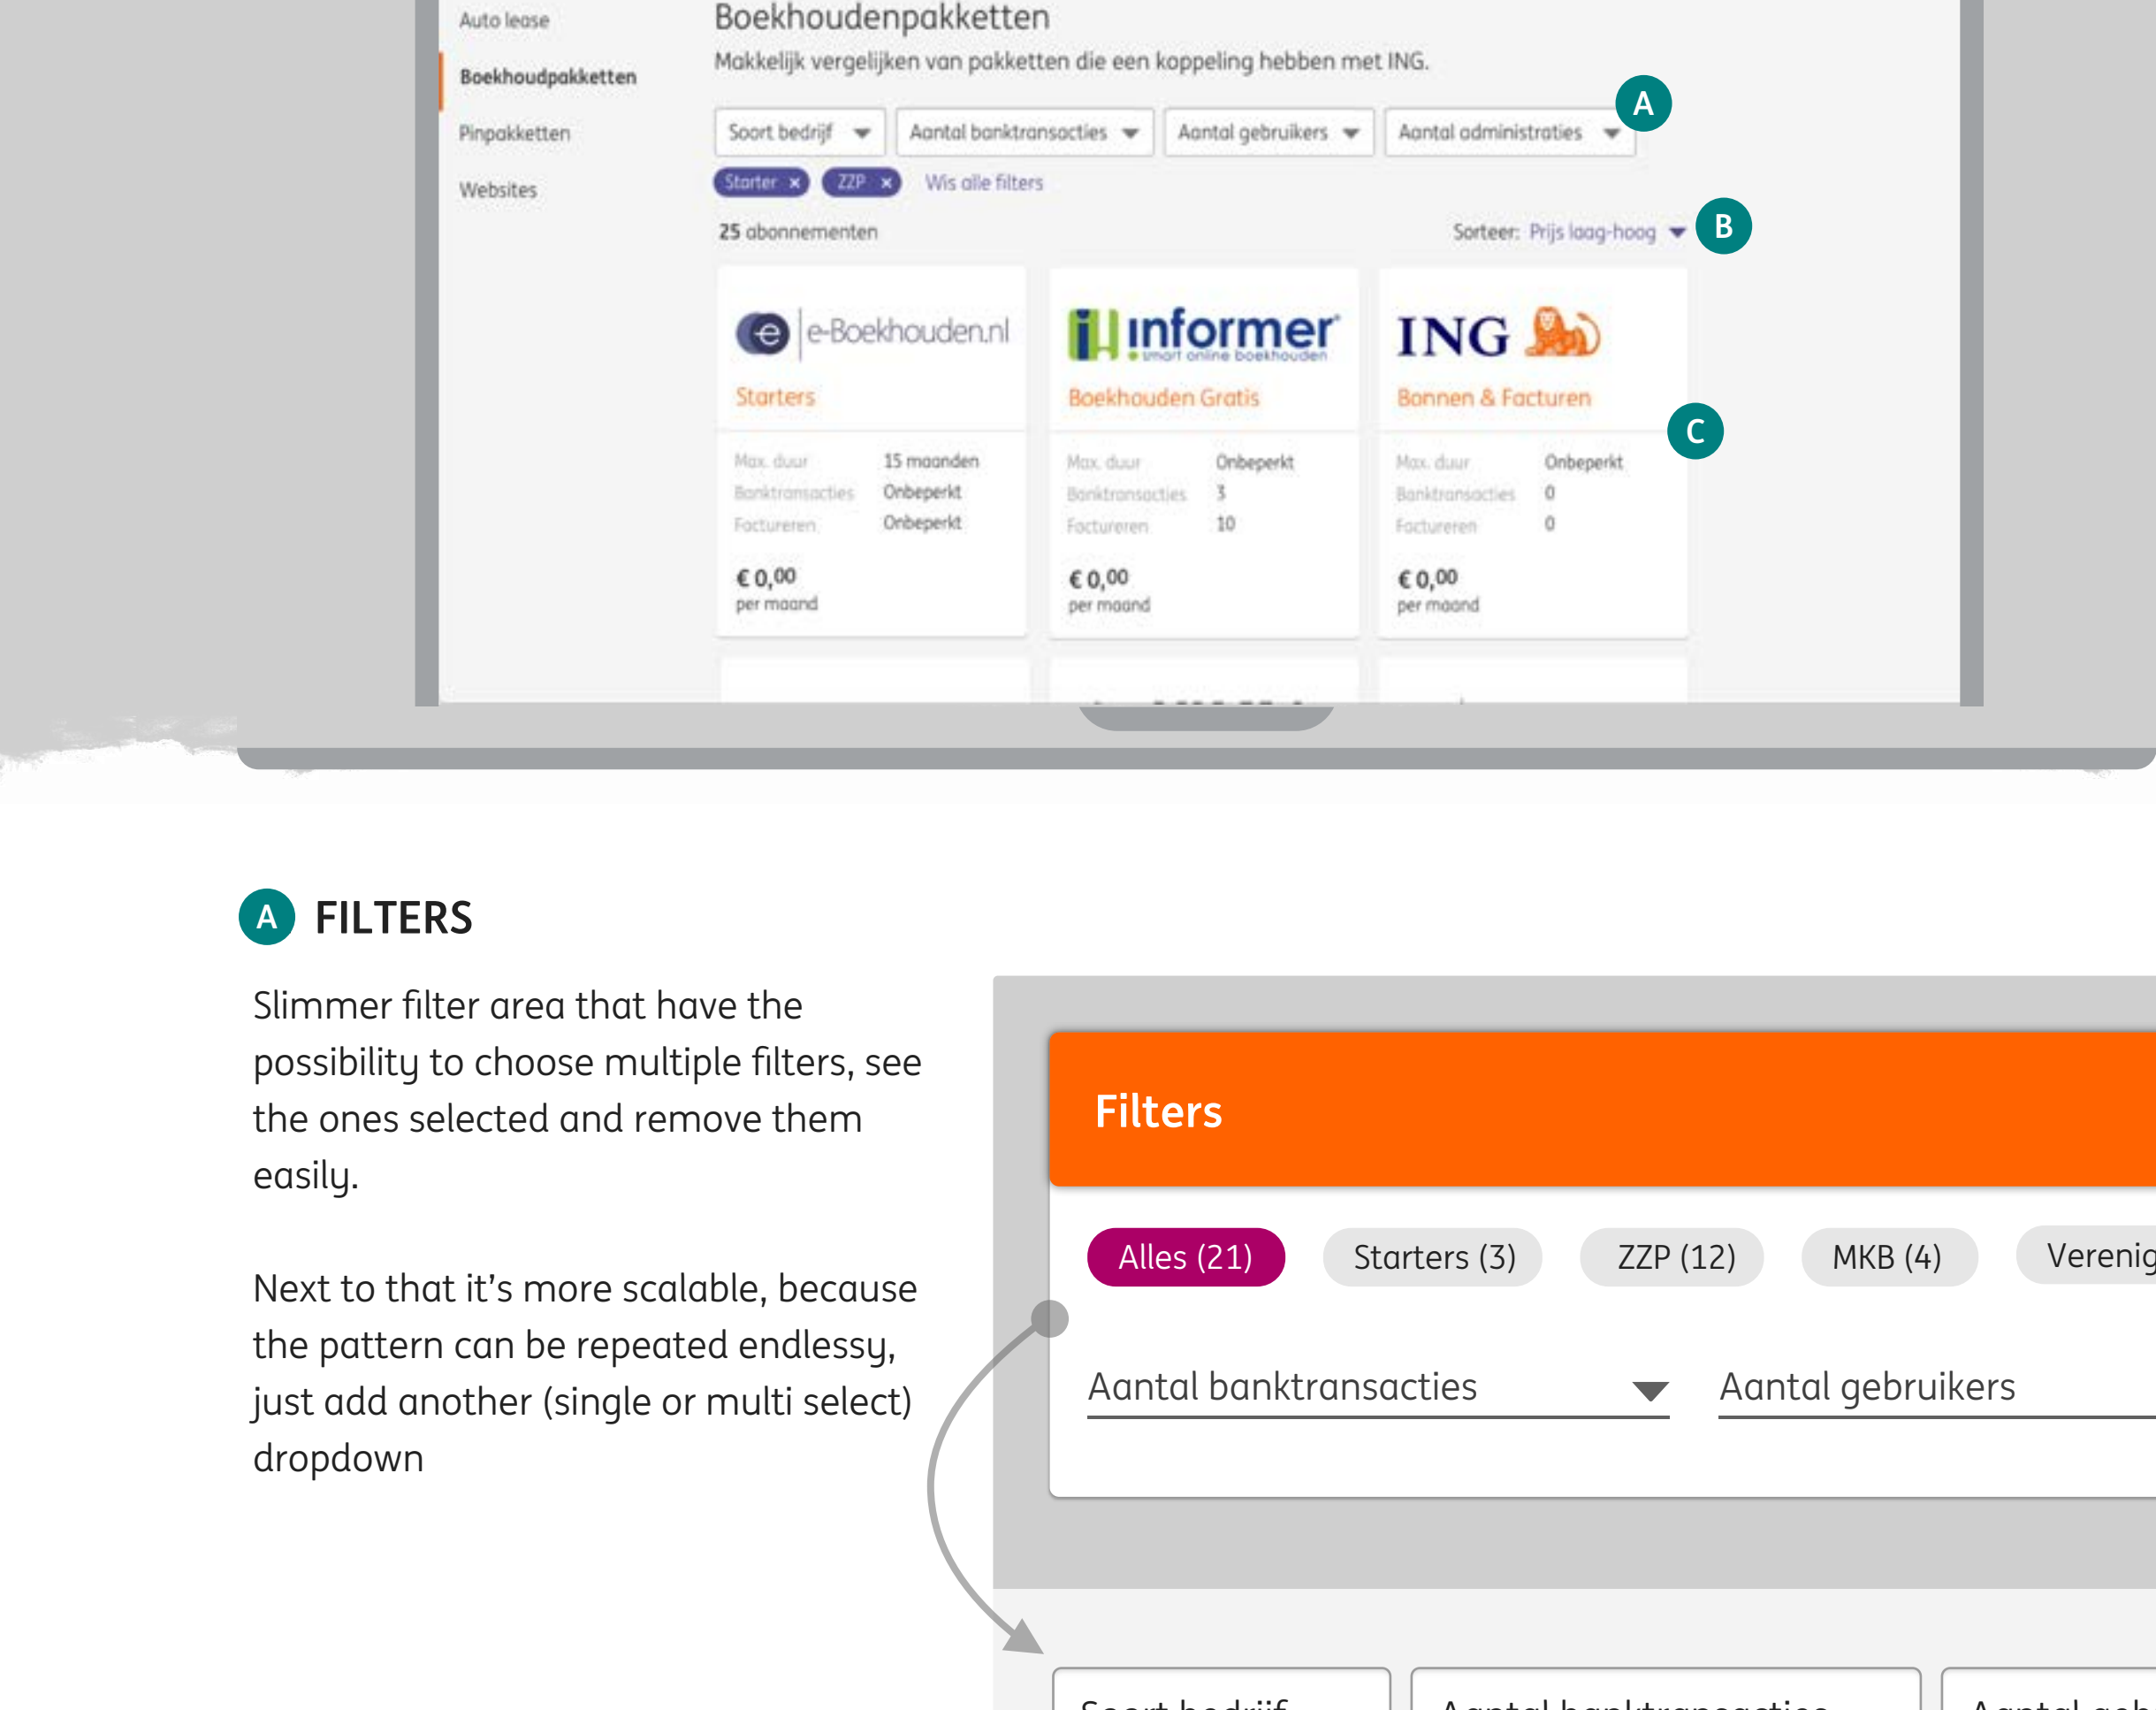

FULL DESIGN & SCALABLE COMPONENTS

After processing the feedback from the users and the squad I finalized the design by making it ready for all screenizes, and making all page components ready to be used for all current and upcoming categories.

The end products

CATEGORY PAGE

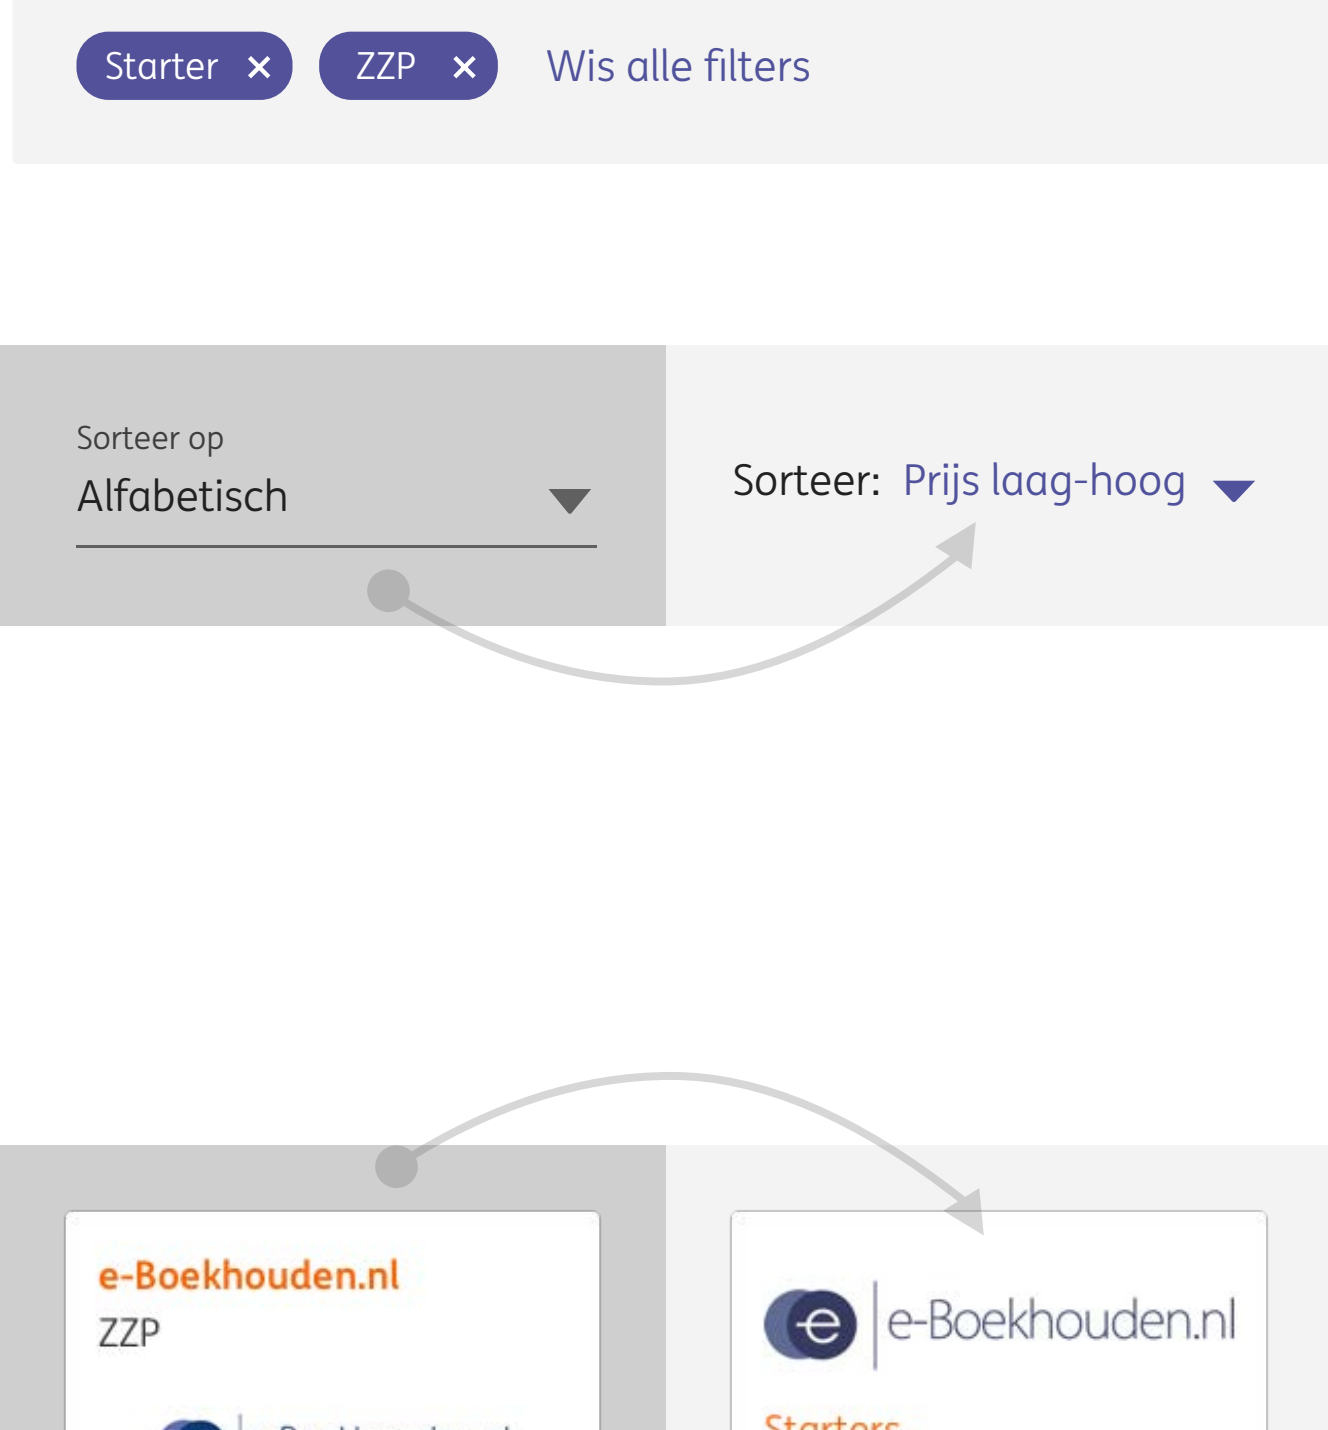

Page that shows all products from a certain product category with the purpose of easy comparison, before diving into the details on the product detail page.

A FILTERS

Slimmer filter area that have the possibility to choose multiple filters, see the ones selected and remove them easily.

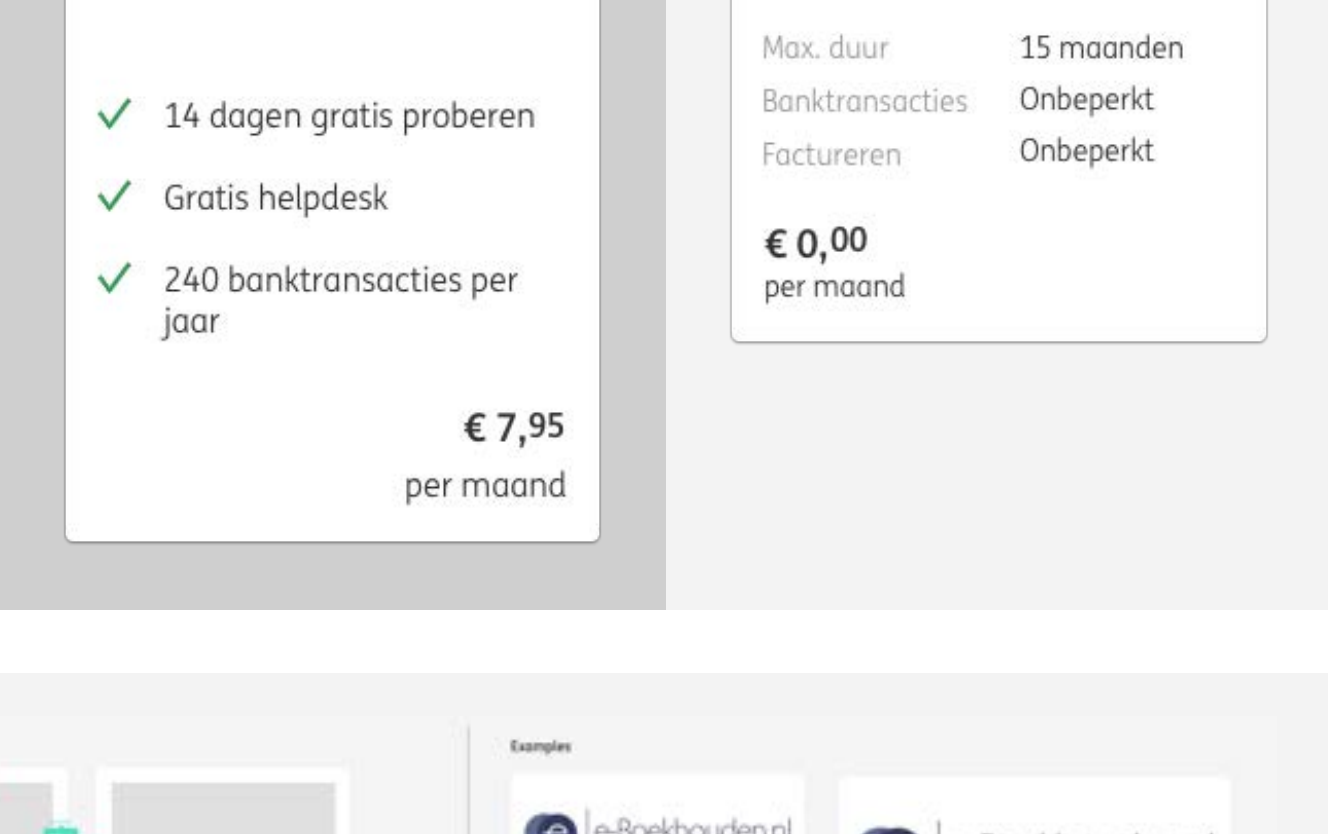

Next to that it's more scalable, because the pattern can be repeated endlessly, just add another (single or multi select) dropdown

B SORTING

Optimizing the space by placing the label next to it and de-emphasize it by losing the underline, because the focus should be on the products.

Next to that changed the sorting from alphabetical to price. Users want to this platform if they had no idea of the providers, nor their productnames.

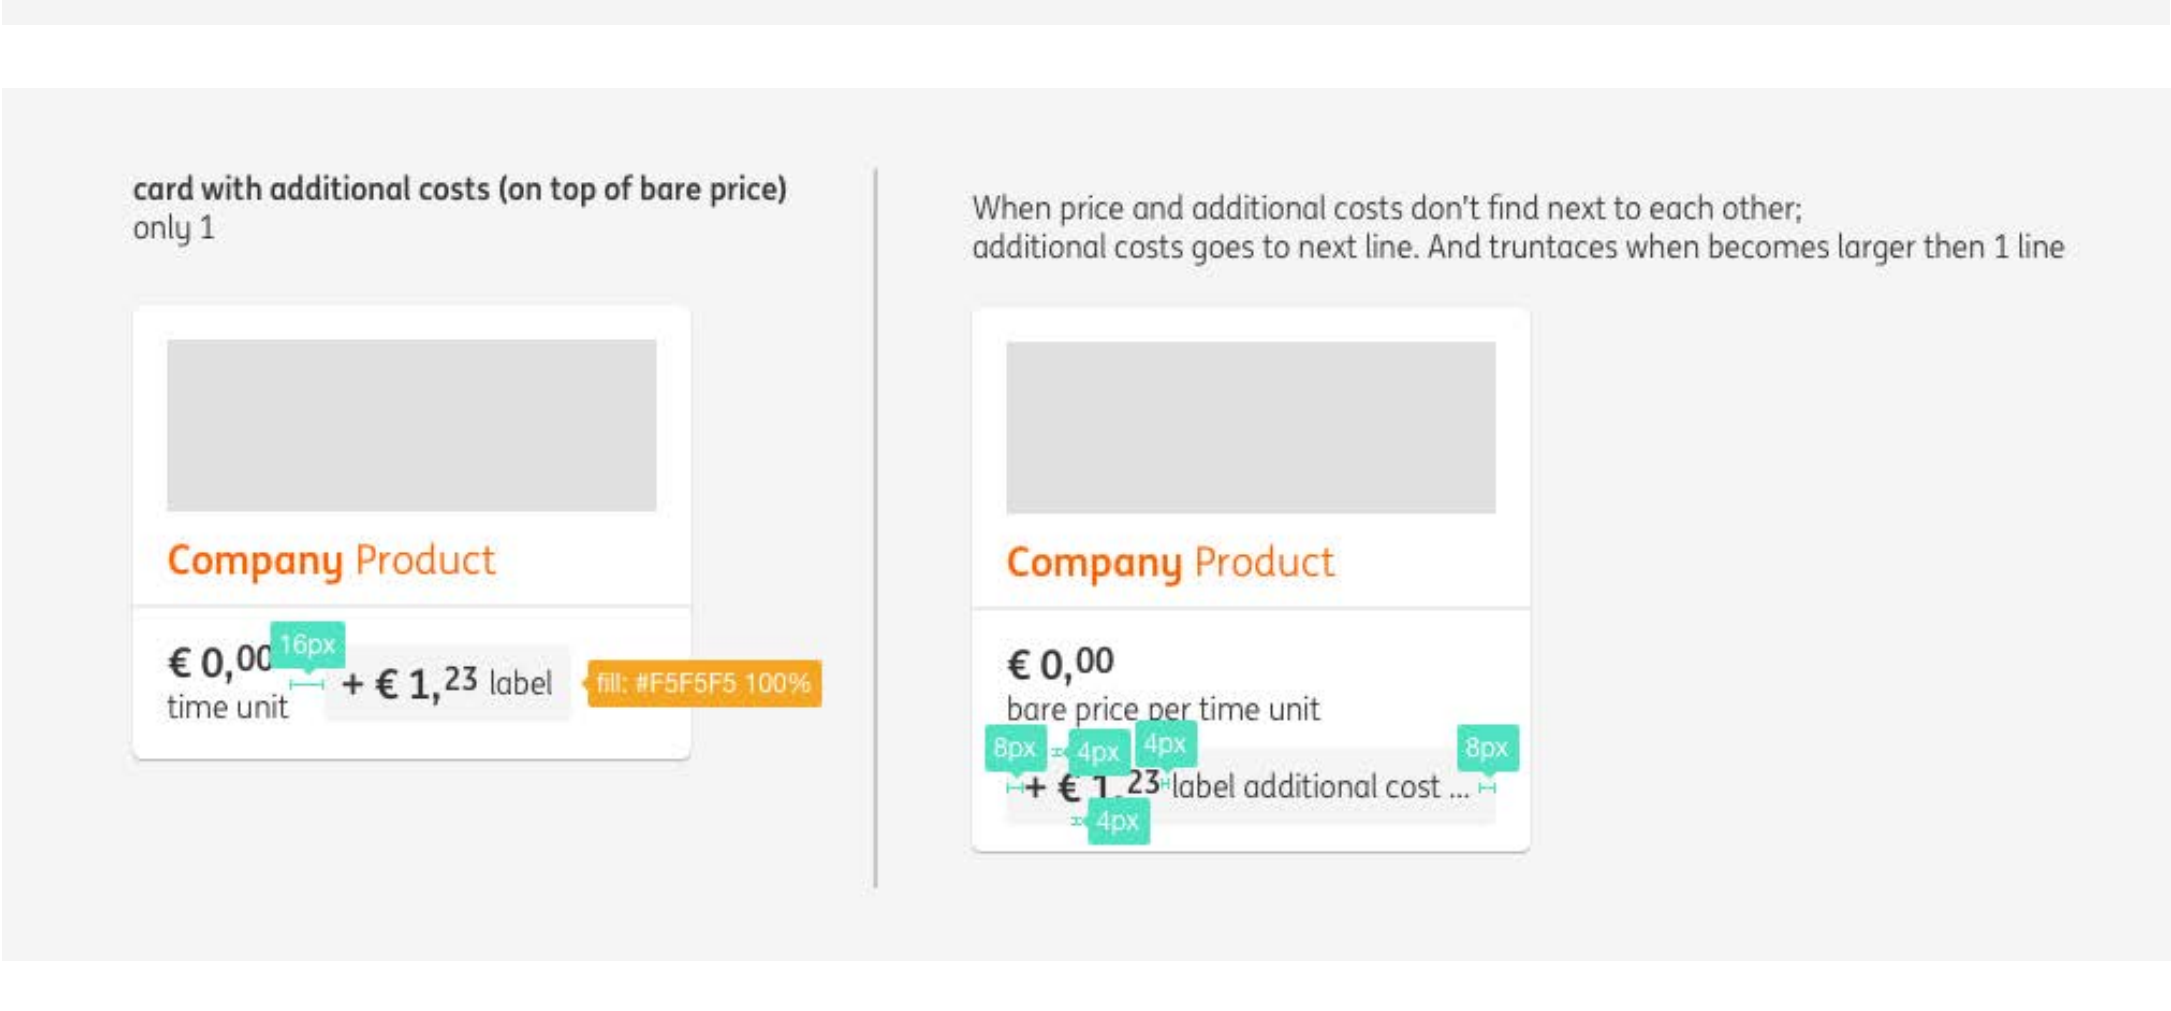

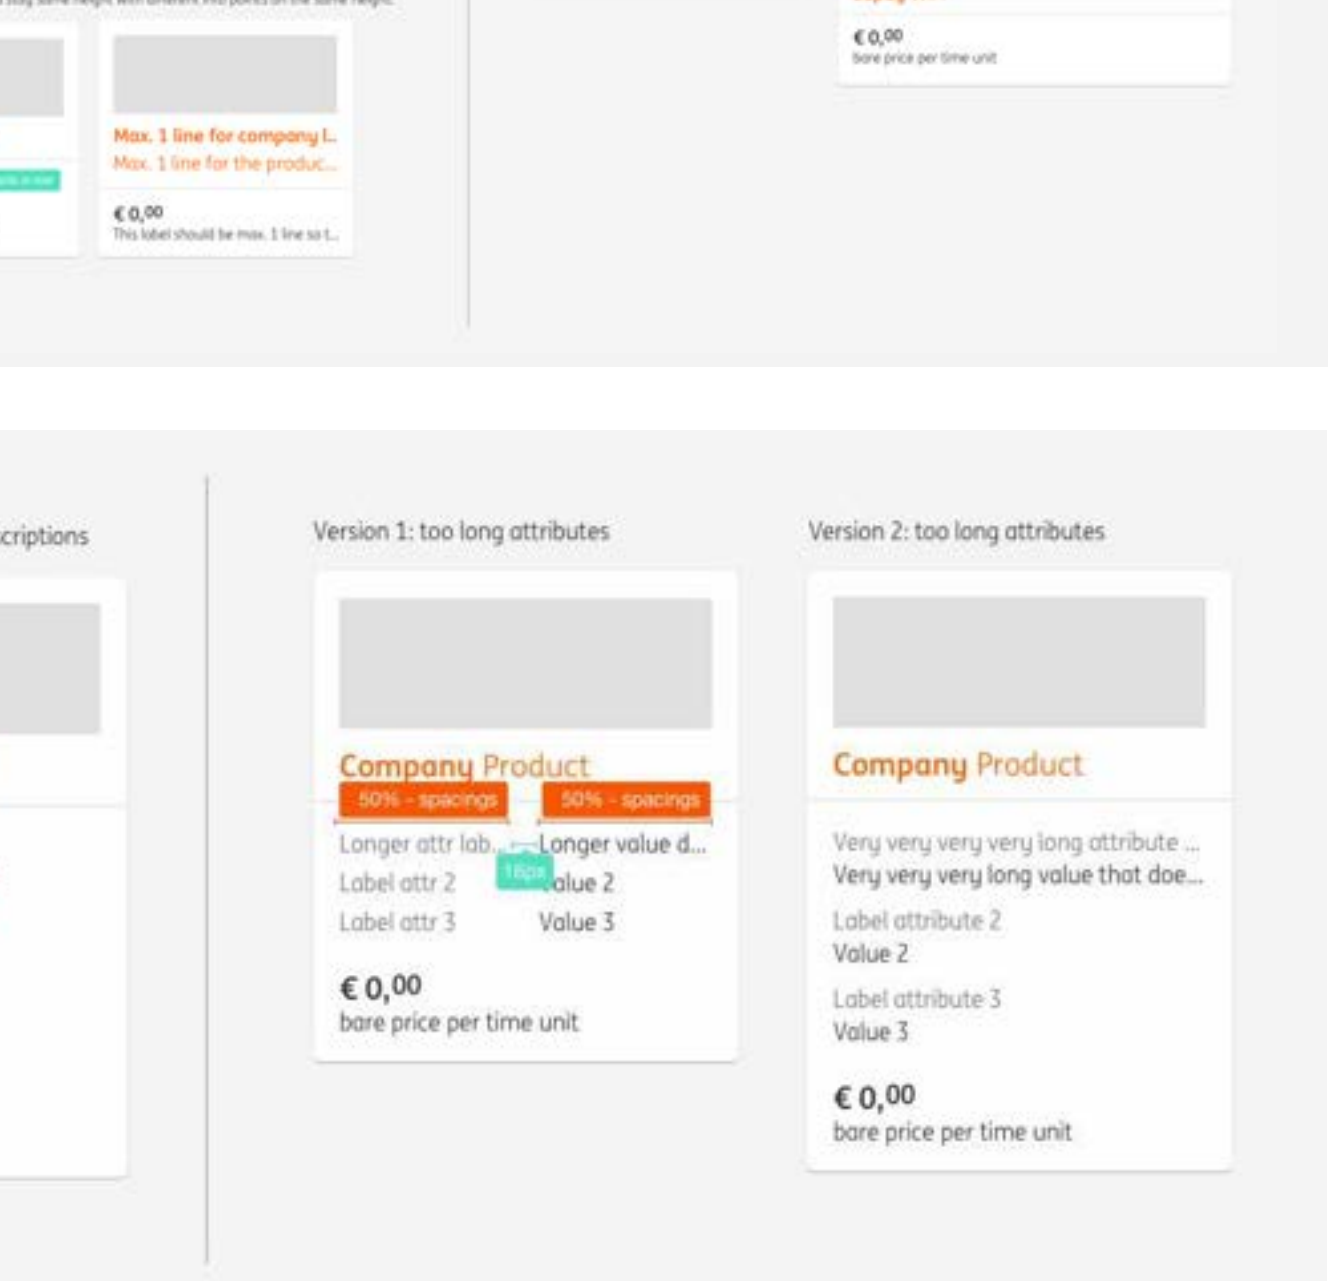

C PRODUCT CARDS

Cleaned up the product card and created two sections for easier scanning: the header and the product details.

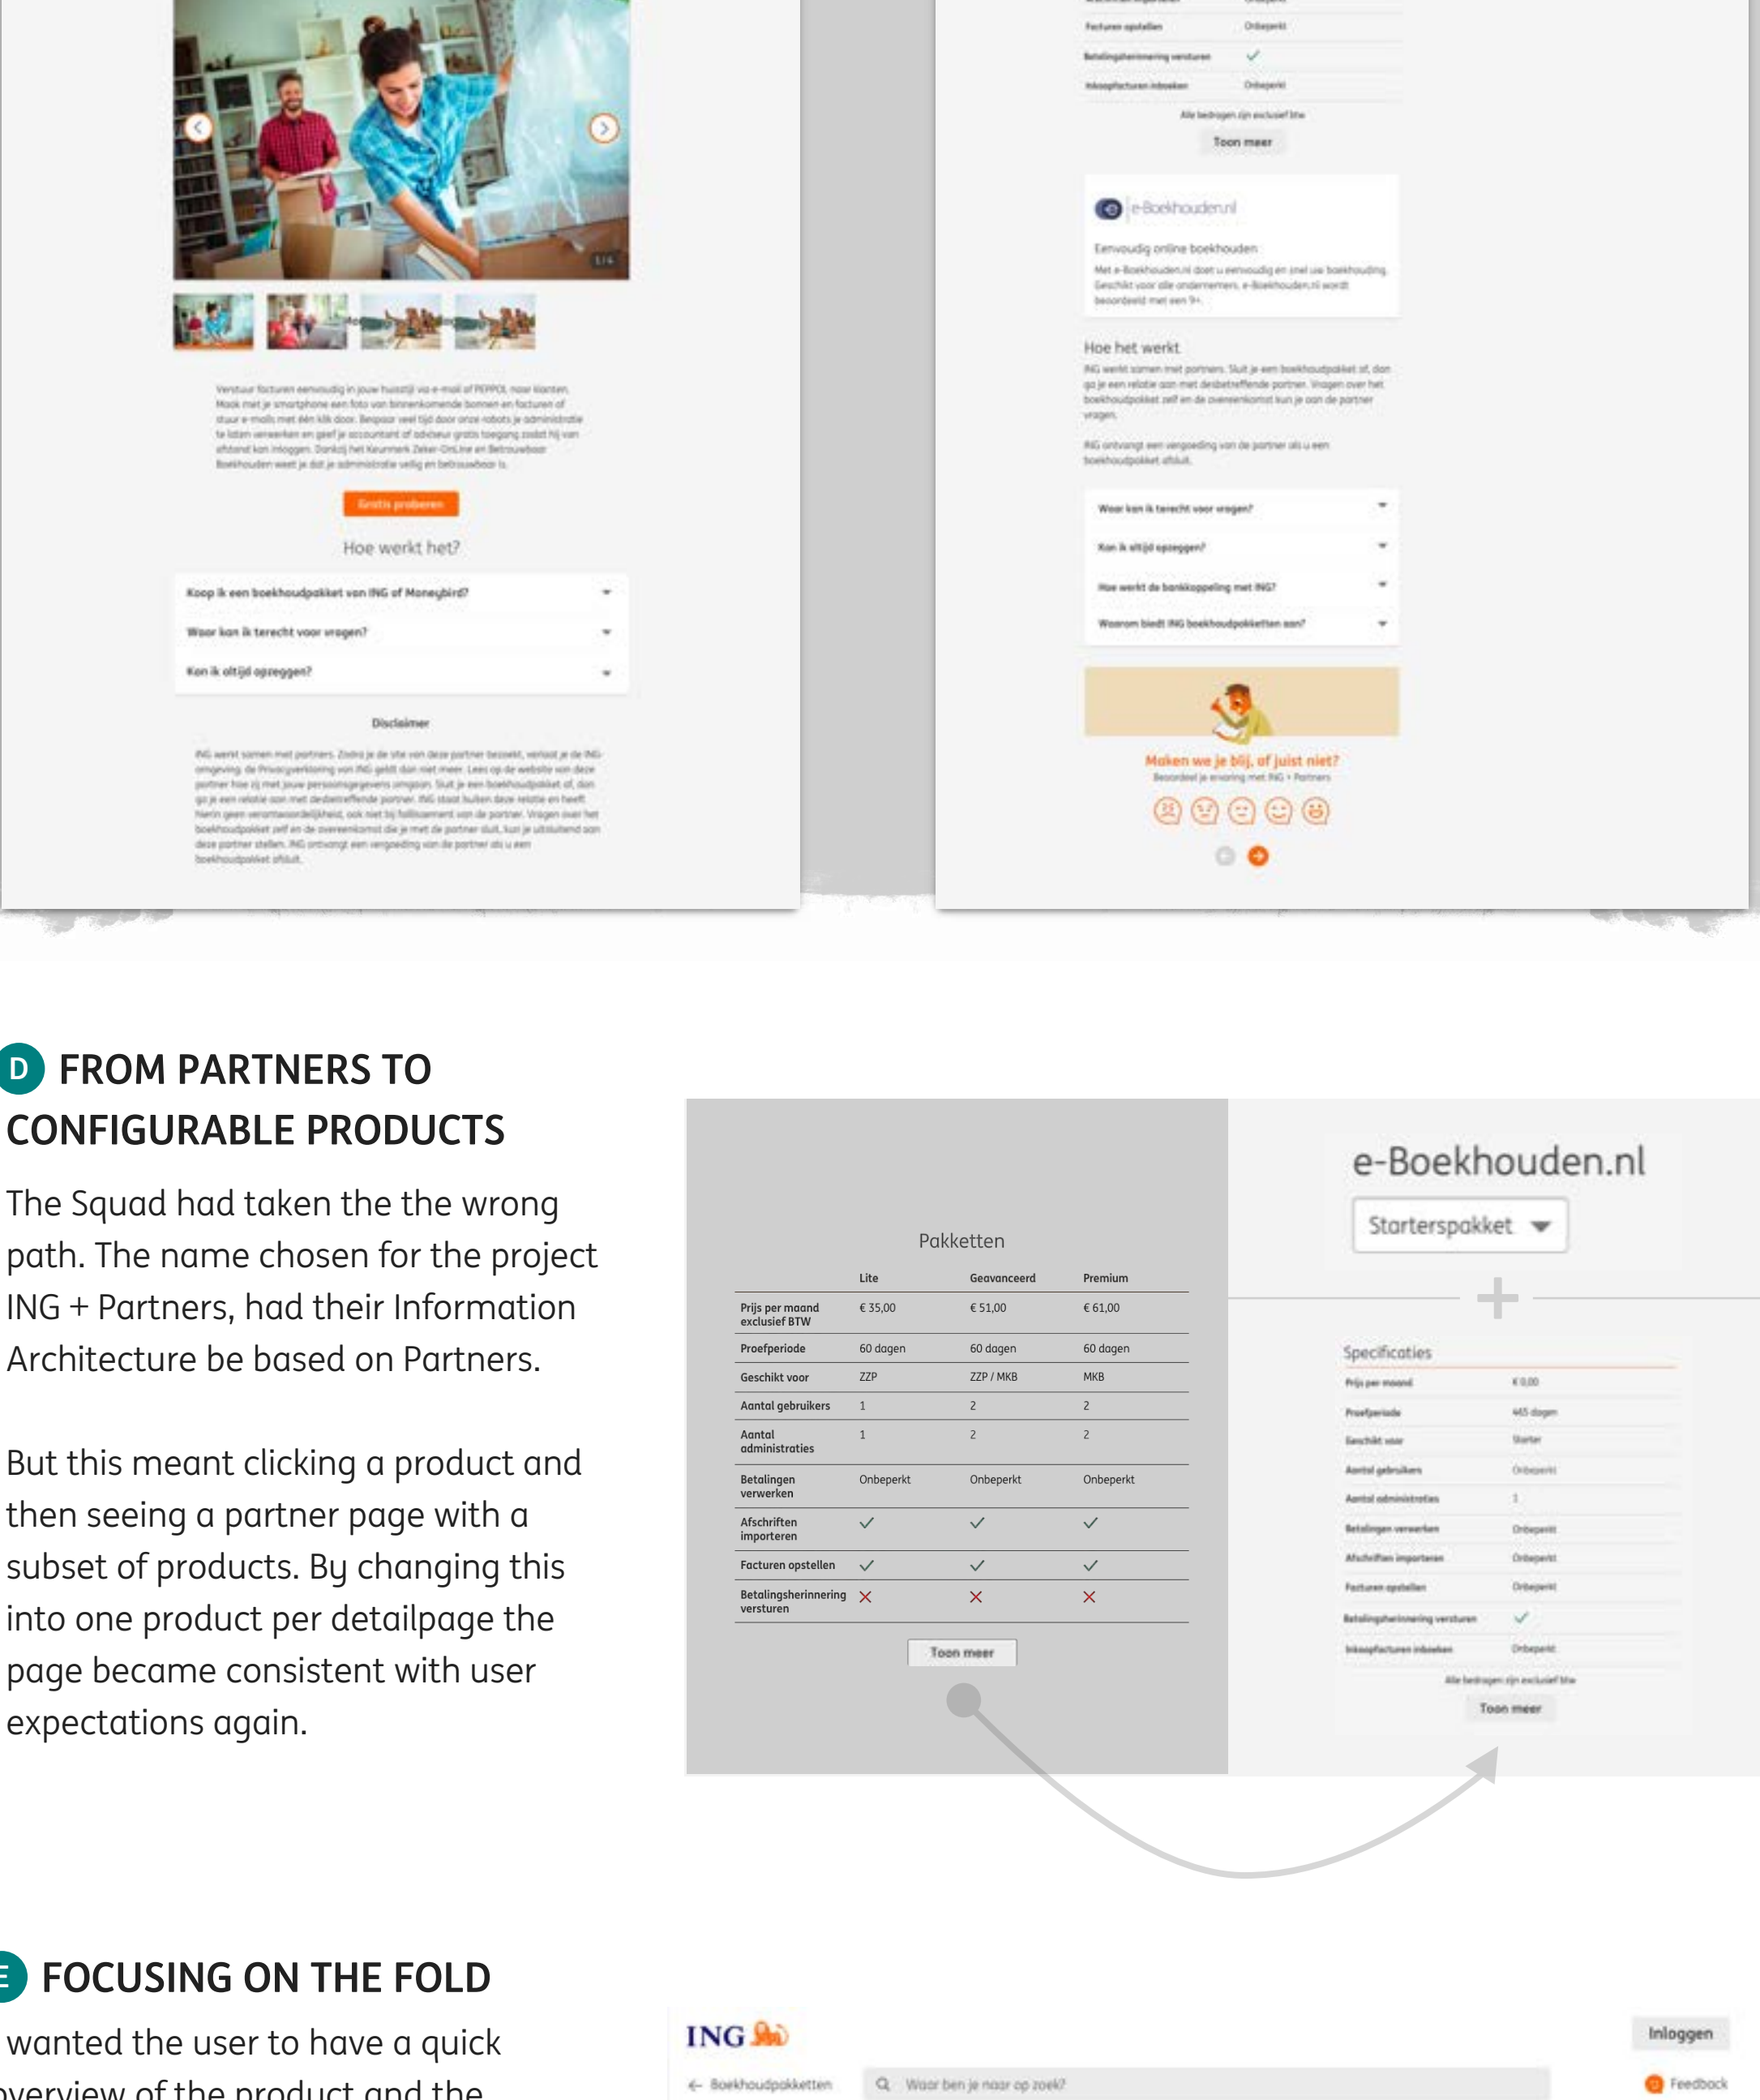

Removed the USP's, because they were not comparable to each other. Replaced them with three overlapping main attributes (category depended).

Created designs for a fully configurable component that you can see below.

PRODUCT DETAIL PAGE

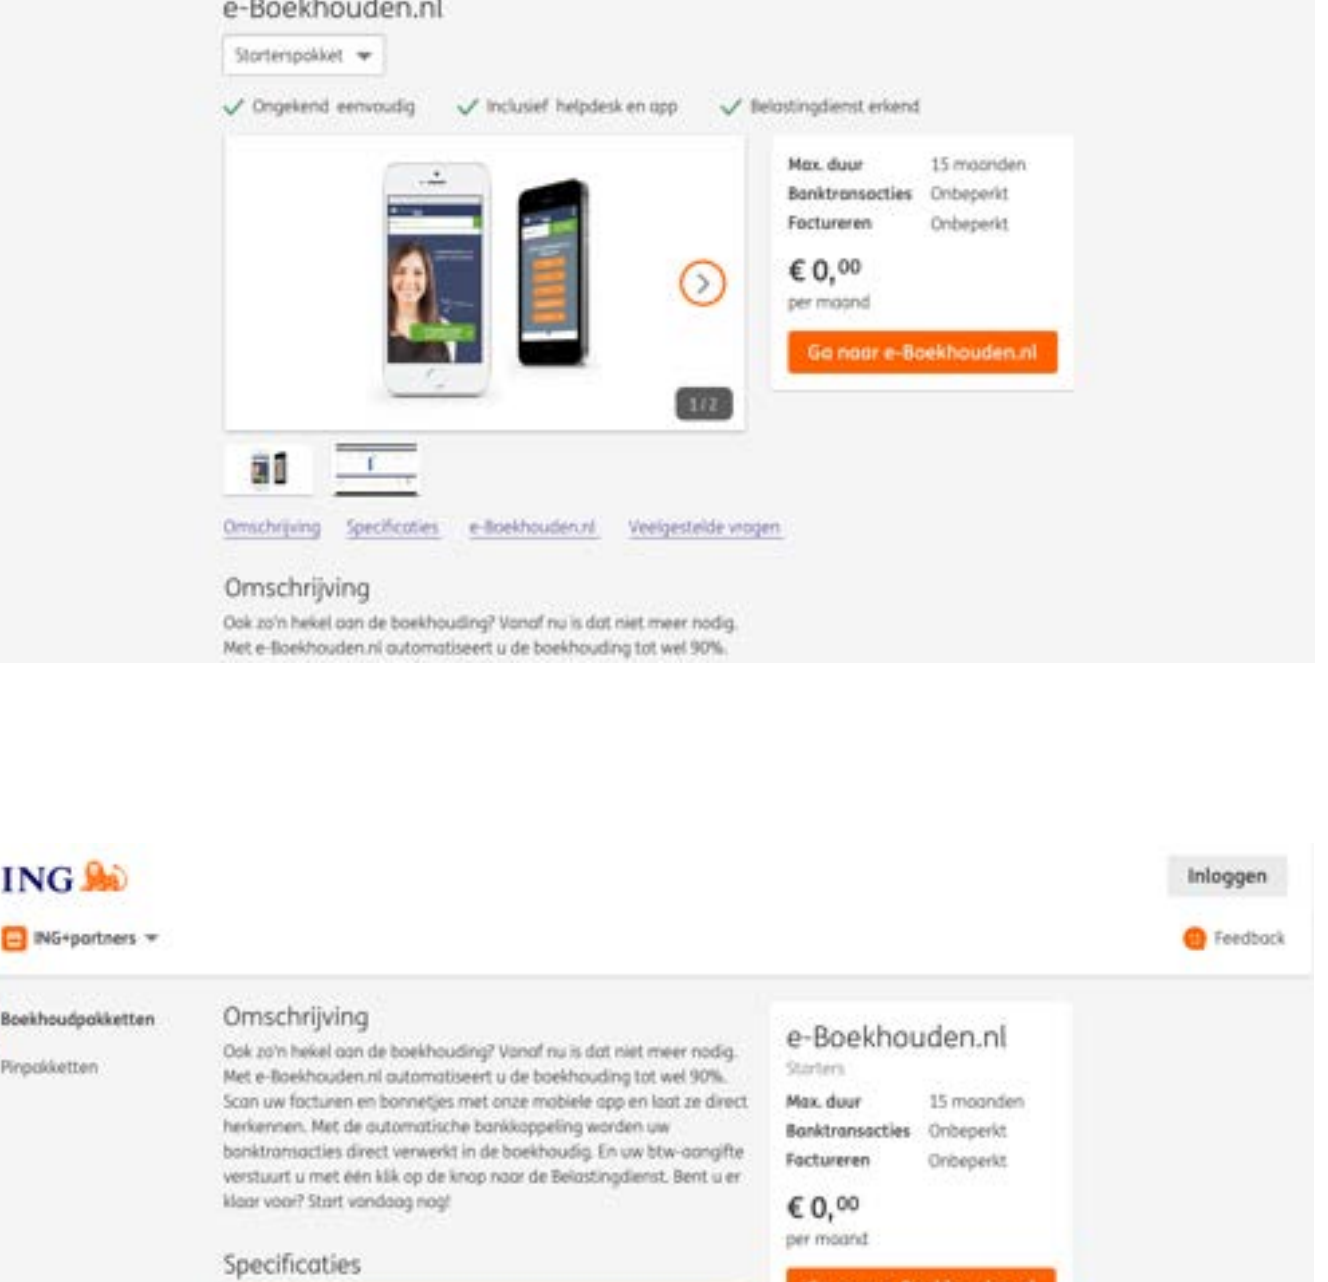

Page that shows all details of a certain product with the purpose of informing the user so that they can make an informed decision before continuing to the partner website to buy the product or service.

D FROM PARTNERS TO CONFIGURABLE PRODUCTS

The Squad had taken the wrong path. The name chosen for the project ING + Partners, had their Information Architecture be based on Partners.

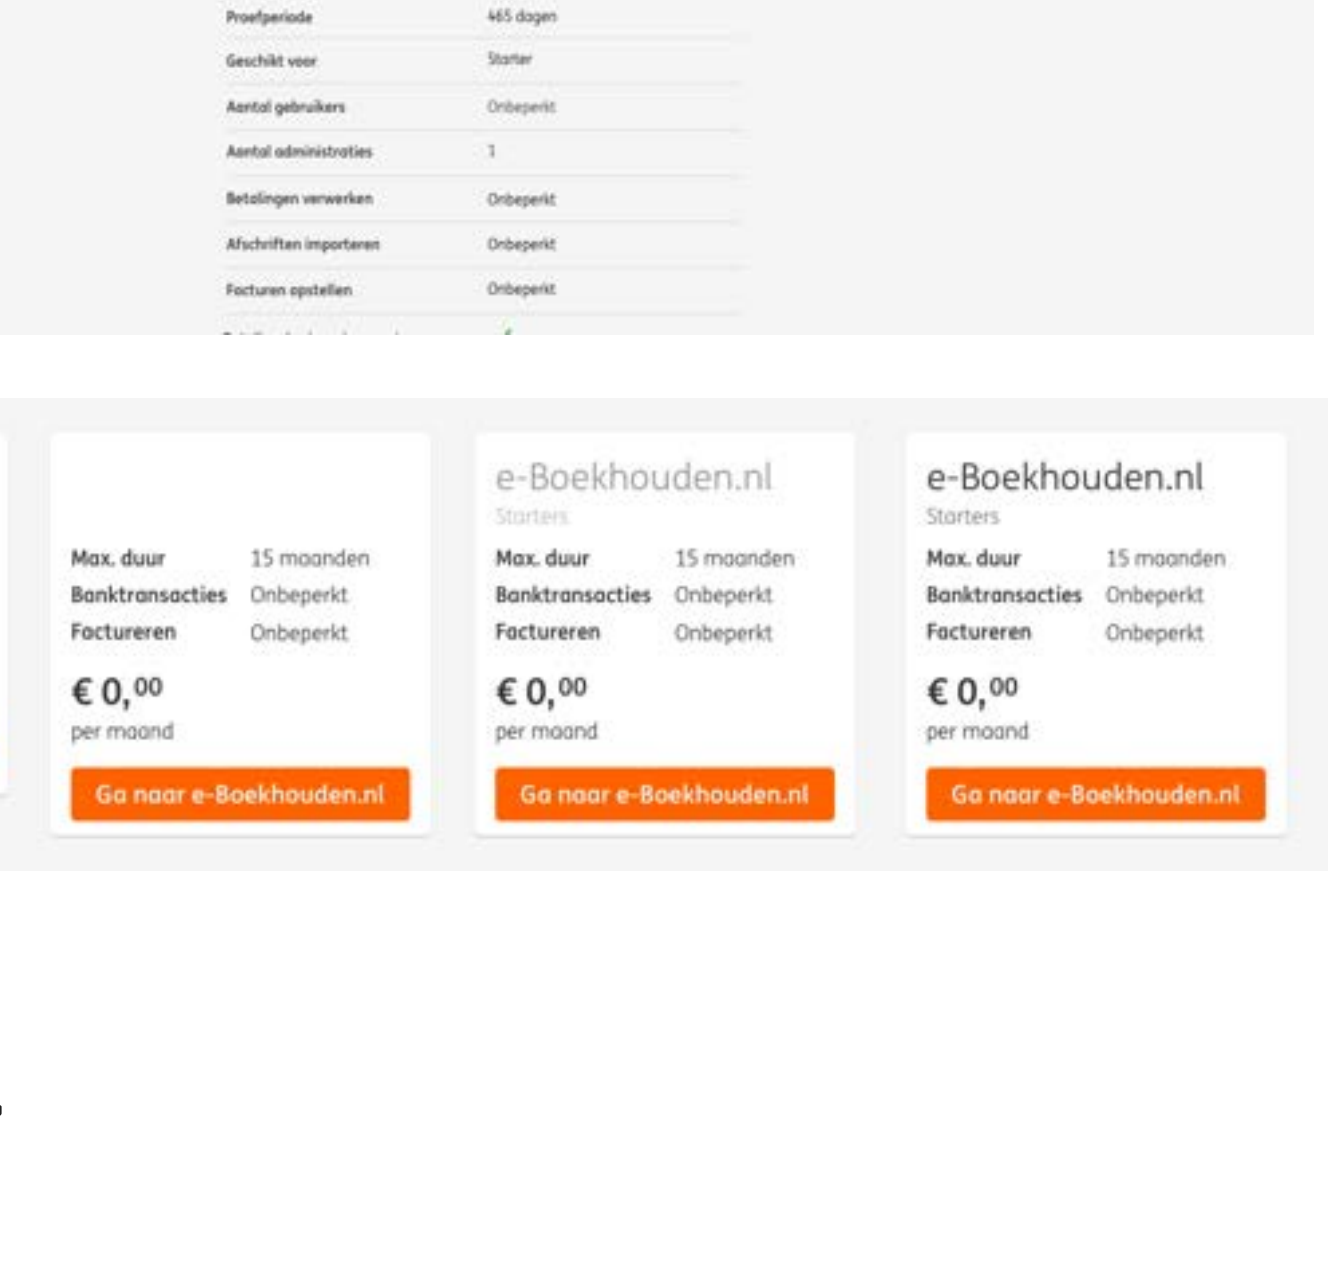

But this meant clicking a product and then seeing a partner page with a subset of products. By changing this into one product per detailpage the page became consistent with user expectations again.

E FOCUSING ON THE FOLD

I wanted the user to have a quick overview of the product and the available information first, before diving into more in-depth information.

I reached that by advocating focus on primary, summarizing content and quick navigation above the fold.

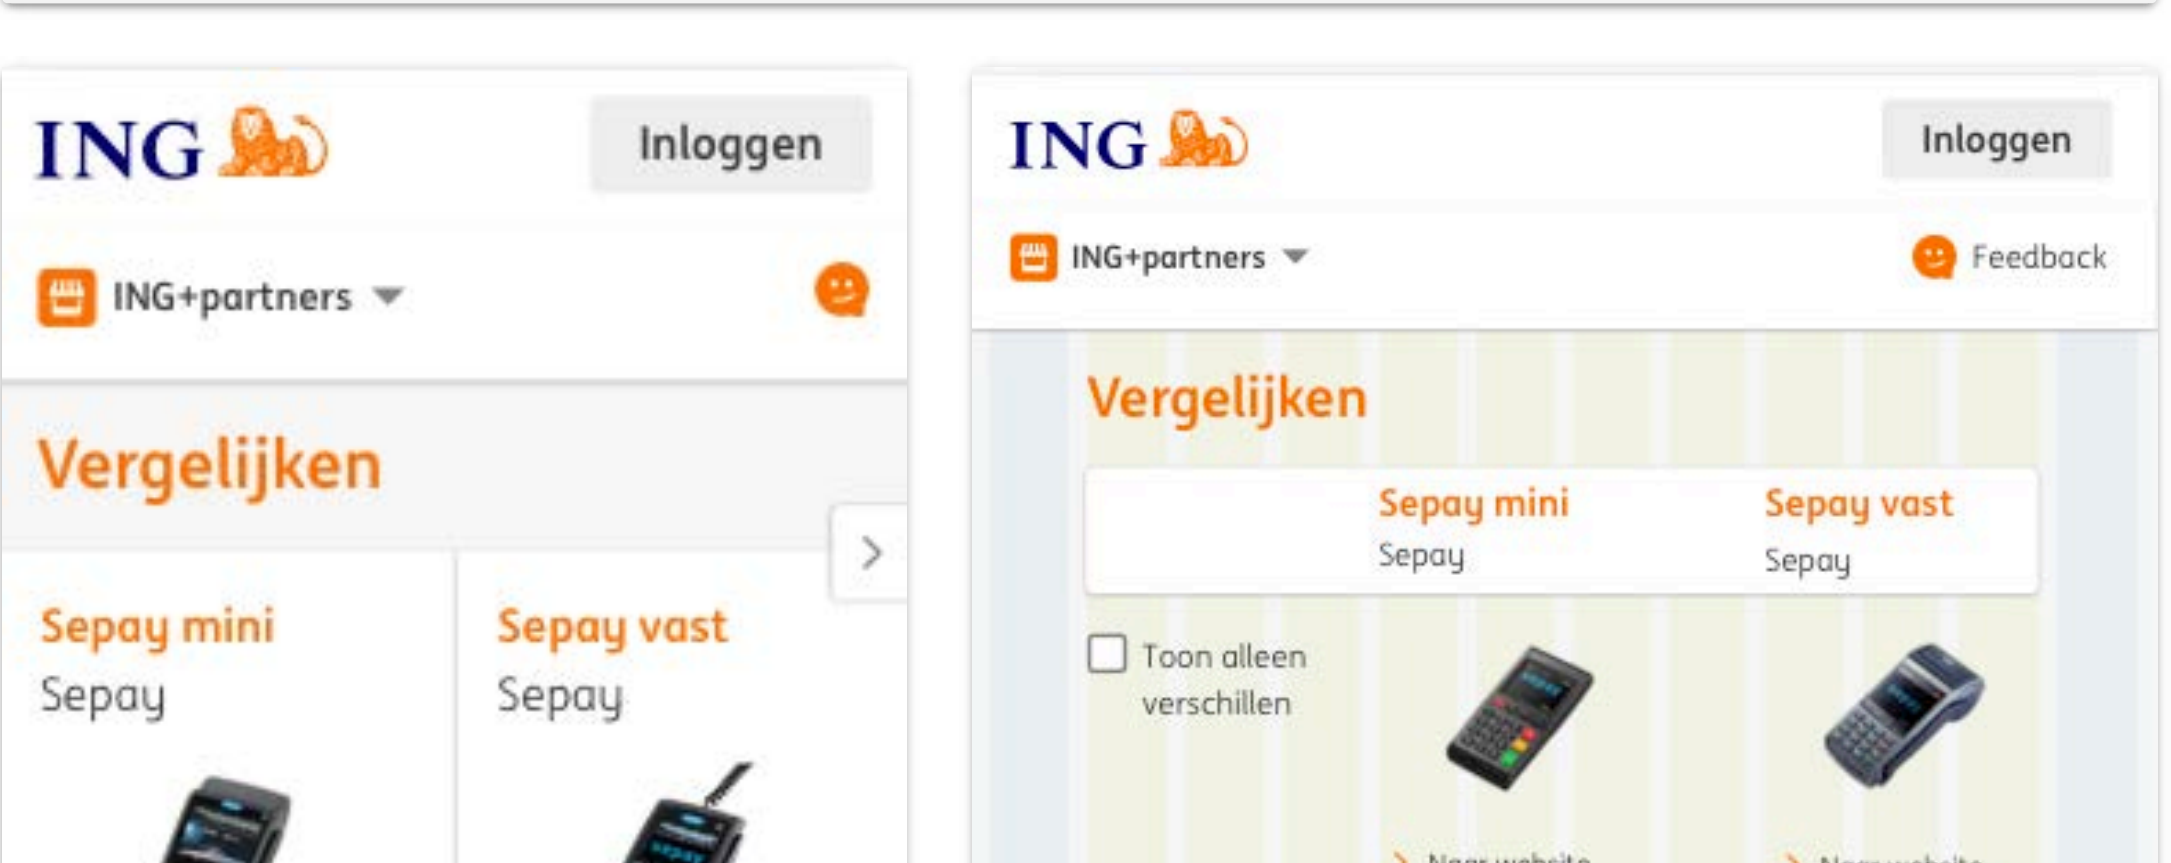

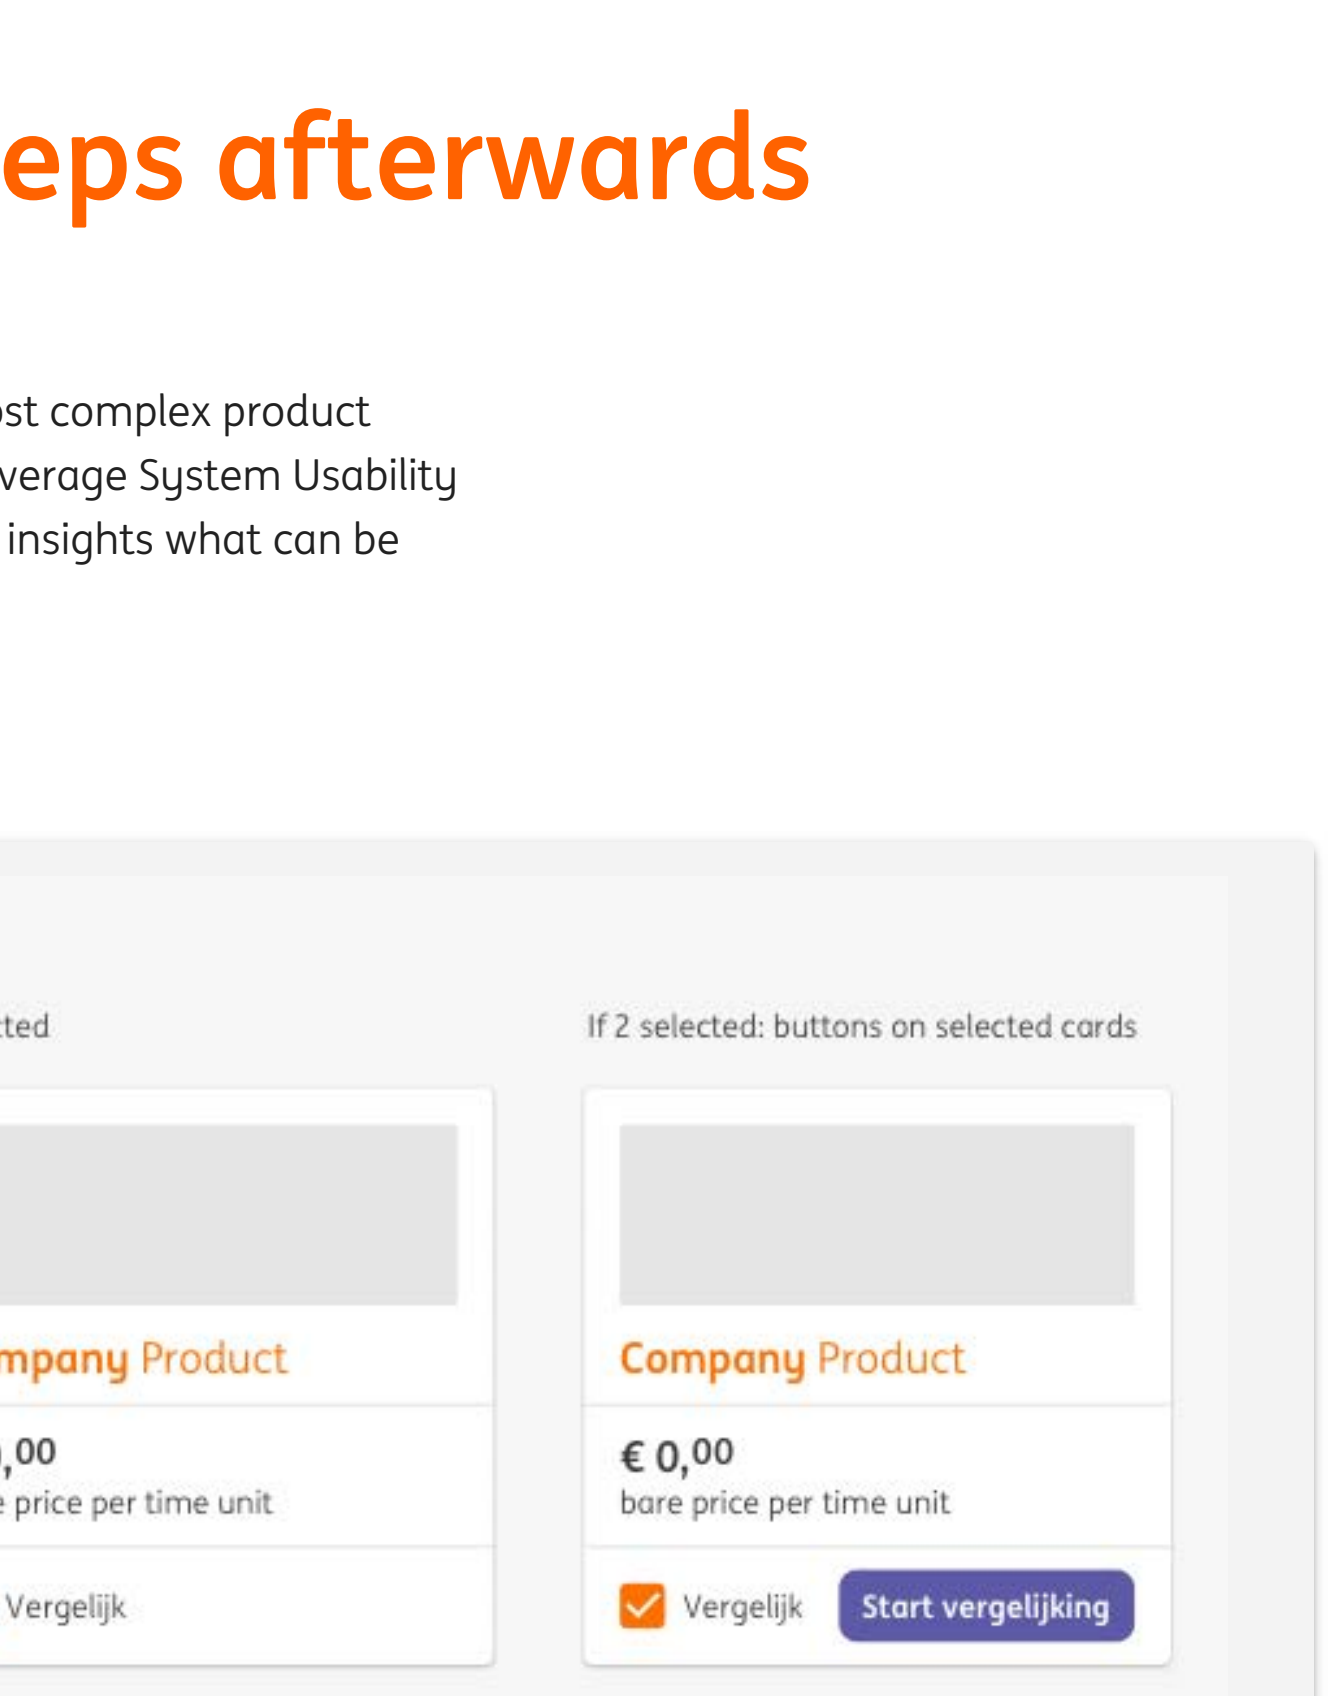

F STICKY PRODUCT SUMMARY CARD

Wherever the user was convinced by the extra information on the detail page she should not need to start looking for the primary CTA.

Next to this the area for the detail page content was too wide for easy reading.

By introducing a product summary card that always sticks (sticky) in the upper right corner both were addressed.

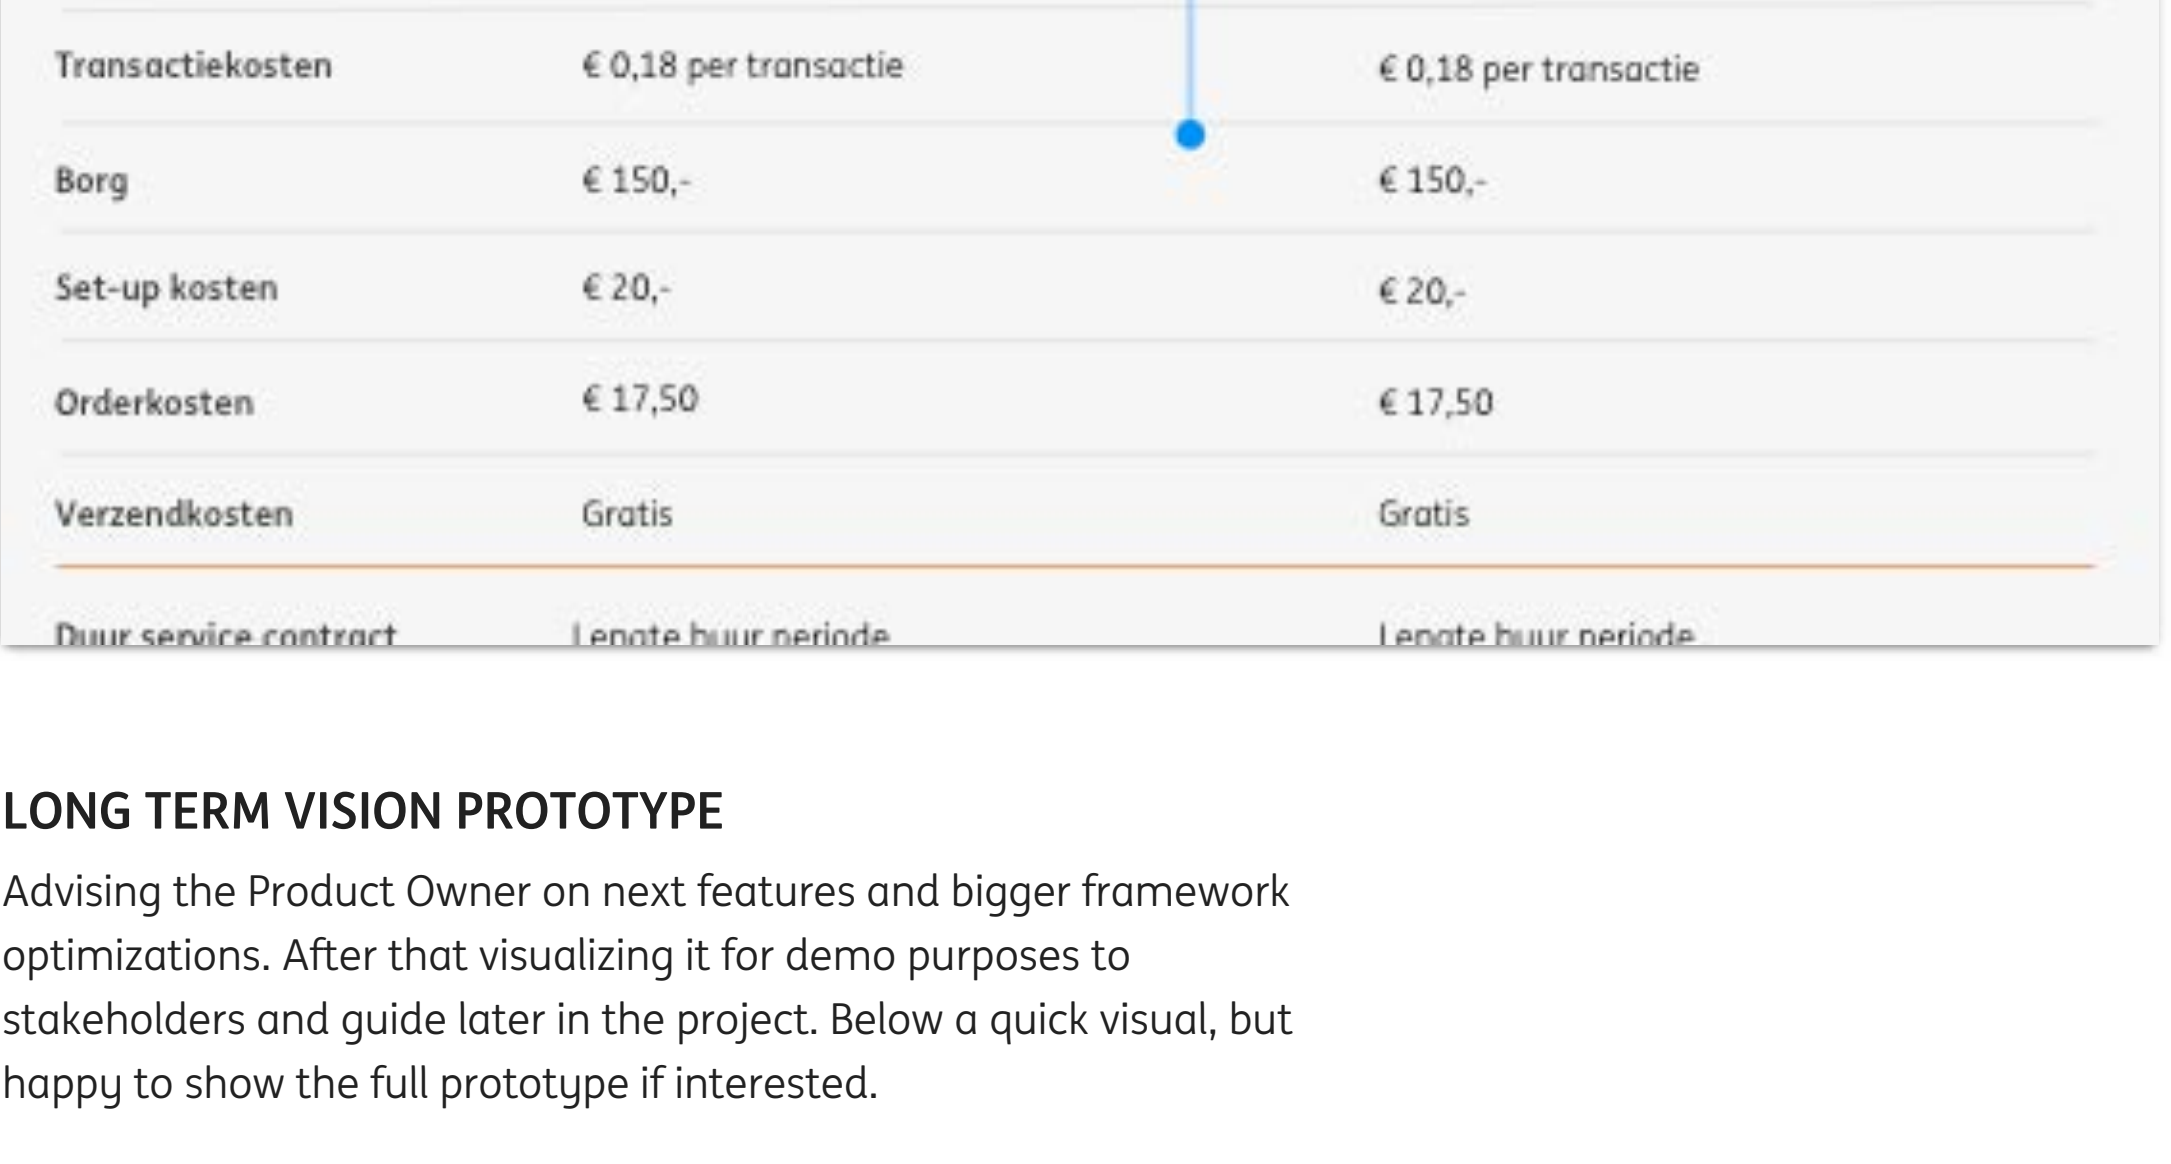

Not yet the end

Nameworthy steps afterwards

USER TESTING

Setup and conducted user tests with the most complex product category: payment solutions. Received an Average System Usability Score of 75 (68 is above average), with clear insights what can be improved.

DESIGNING COMPARE & SELECT

LONG TERM VISION PROTOTYPE

Advising the Product Owner on next features and bigger framework optimizations. After that visualizing it for demo purposes to stakeholders and guide later in the project. Below a quick visual, but happy to show the full prototype if interested.
